SRN: PES1UG24AM914
Section: F

Architectural Choice:
The system uses a Layered Architecture consisting of Presentation, Business and Data layers.

Reason 1:
Layered architecture separates the user interface, business logic and database, making the system easier to understand and maintain.

Reason 2:
The architecture is suitable for the system because functions such as solar generation recording, credit transfers, dispute management and billing can be handled separately.

Security Advantage:
The layered structure prevents users from directly accessing the database. Access to credit and member information can be controlled through the business layer.

Performance Benefit:
Separating the components allows frequently used operations such as viewing credit balances to be handled efficiently without changing the database or user interface.
